

SPARQL PROTOCOL AND RDF QUERY LANGUAGE

TERMS

- **TRIPLE**
A 3 property object that identifies the value of a property on an object instance within a RDF Graph
 - **SUBJECT**
IRI
 - **PREDICATE**
IRI
 - **OBJECT**
IRI or Literal
- **TERM**
A single item within a triple; subject, predicate, or object
- **QUERY VARIABLE**
Identifiers that are bound during the execution of a query.
Ex: ?someVar
- **TRIPLE PATTERN**
A RDF triple identifier that may contain query variables for binding. Ex:
<subject> <predicate> ?someVar
- **GRAPH PATTERN**
A triple pattern that is used during query execution to bind query variables and return matching results. Written within {...} and using “.” or “;” to separate triple patterns. “;” is used when two triple patterns share the same subject and is a shortcut allowing the second triple pattern to exclude the subject declaration.
- **PREFIX**
A XML style QName can be used to shorten IRI references in triple patterns if a PREFIX is defined at the beginning of the query. Ex: PREFIX pf: <IRI>
- **PROJECTION**
The set of variables returned by a query
